SOFTWARE EMPOWERING THE ENTERPRISE

Quality-CAR Module

The Quality CAR (Corrective Action Reporting) module provides functionality to enable management controls that enhance the ability of enterprises to discover and track quality discrepancies both inside and outside of the organization. Quality Inspection Checklists allow Material Receivers to enforce detailed inspection procedures that are required by the organization or for individual customers, and they allow complex multi-step findings to be recorded for each line that is received. Corrective Action Reports enable organizations to keep precise records of discrepancies, track defects in materials and processes, manage health and safety incidents, and ensure corrective actions that resolve issues.

Quality Inspection Checklists:

- Create unique checklists by part number and part number category
- Create unique checklists for each type of receiving document, such as purchase receiver, sales receiver, return materials authorization (RMA) and warehouse transfer
- Record the expected result and range of findings for each inspection in either numeric terms (including tolerances) or by using plain text
- View results in receiving documents and in the warehouse
- Export results to .CSV file
- Print Inspection results from Receiver & Pick Ticket
- Foster advance sampling method for parts Inspection

Corrective Action Reports:

- Capture quality management events from both inside and outside of company business process framework
- Assign a status and priority to each Corrective Action Report for efficient and effective management
- Categorize each discrepancy to facilitate trend analysis
- Print reports for distribution
- Link reports to an unlimited number of existing documents to provide backup to the discrepancy or corrective action
- Attach scanned documents, images, or videos to each corrective action report
